- A small vote of thanks for all who are helping me in this journey of my App Development – my parents, Mr Ken who has given us feedback, our mentors who are ever ready to guide us, GeeksForGeeks, [amine gasa](#) who has uploaded a video on my topic, Felix Joseman who is another youtuber...his app is an inspiration.

About Me..

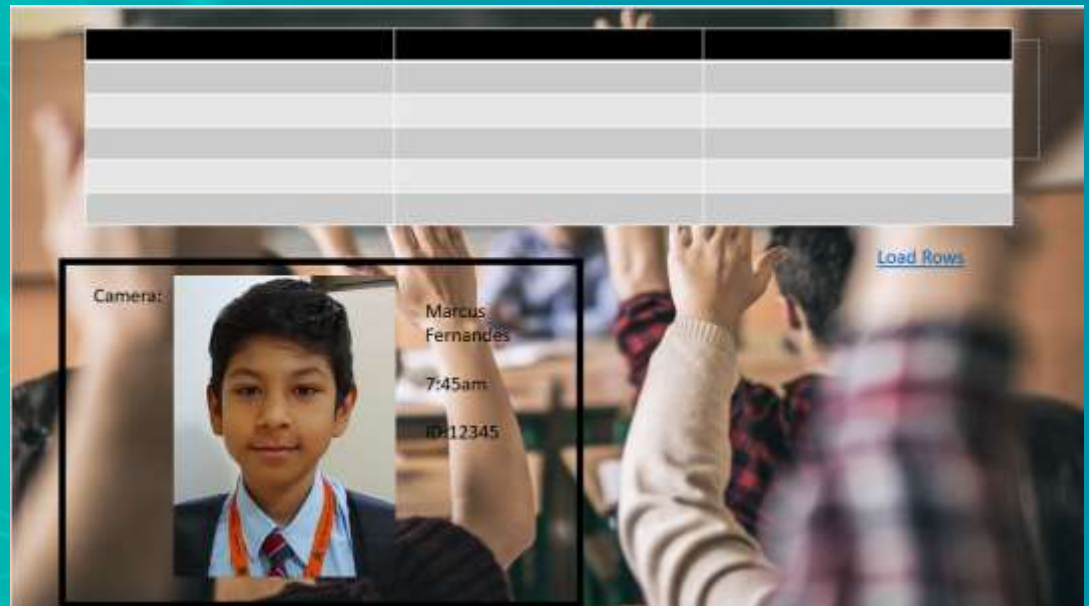

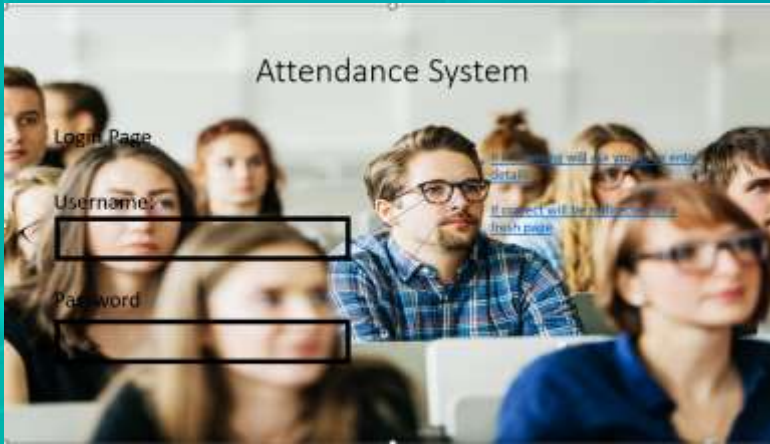

My name is Marcus Aiden Fernandes..... I am 11 years old and study in the Winchester school Jebel Ali Grade 7. It is an honor to study and code under the guidance an honored professor. I am delighted to learn from them. The things that interests me the most is when you get an error and must find away to resolve it .

I expect that I will learn many new things using new libraries such as open cv with helps to identify image/face recognition.

About My Internship with Clevered..

So far, I am really enjoying the classes.... I am delighted to attend the classes every Monday, all ready to learn something new

About App..

Introduction of project

I have chosen the Face Recognition -Attendance Marking System..... Since my mom is a teacher, I have decided it will be useful to have a machine to do the attendance for her instead of her counting heads and calling out names. This project saves lots of time and eco friendly. Because of these reason I have chosen this project.....

In this project here you must collect some images of friend or any people and make a database. Using a webcam, you have to identify faces and detect whether captured image match with the image in database; if yes then show present otherwise show absent hence it makes the teachers job easier.

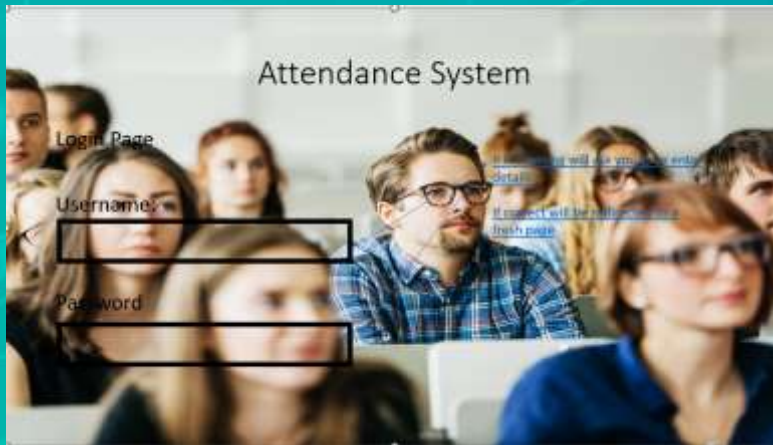

How do I use the App?

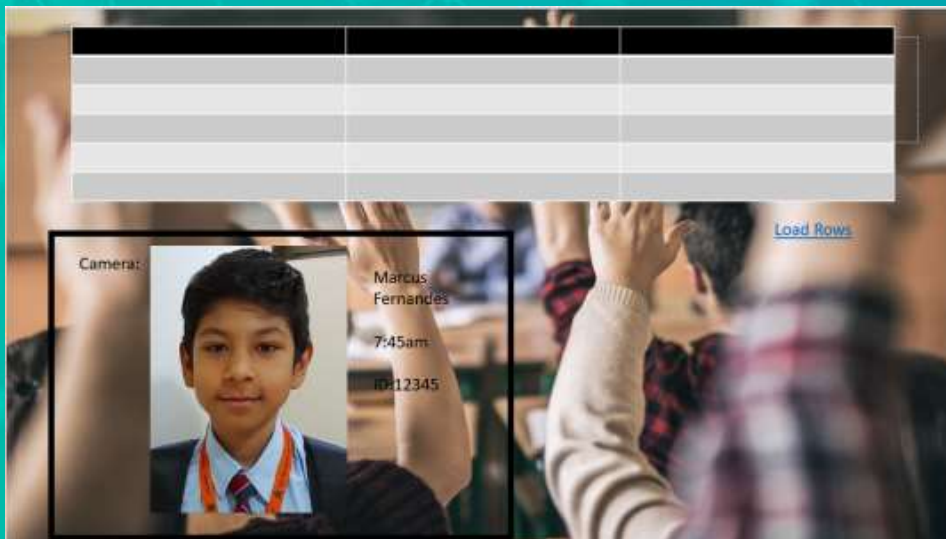

Attendance Automatic System

AAU

Marks your attendance in just a scan

First option screen is the login page...if you enter wrong details it will ask you to re-enter

Once you have entered the correct credentials a camera will pop up and will begin to detect faces. Next to the camera a table will be shown. Once a face is detected you need to click load rows which would show the details of the child
